TÁVO

Giving used plastics and sawdust a second life in the production of quality furnitures for use in schools, universities and offices, helping to prevent pollution.

TÁVO

OUR MISSION

Product: Produce quality furnitures from sawdust-plastic composite materials.

Economic strategy:

TÁVO

DESCRIPTION OF THE BUSINESS IDEA

Why it is innovative and sustainable?

The project is located in Kétou, a town that's close to many wood processing units and is also known for its commercial activities through trade with Nigeria. As waste management companies are not well developed, the city faces many challenges in terms of waste management. On the other hand, the many schools as well as the UNA are facing many shortages of furniture due to the increasing number of pupil and students.

At "TÁVO" we propose the recycling of sawdust and plastic for the production of high quality composite materials that will be transformed into furniture to compensate for the lack of this equipment that is necessary for quality education. In this way we save the CO2 that would have been released into the environment by burning these products.
